Dear Colleagues,

On behalf of the organizing committee I would like to welcome you to Istanbul for the **ASME 2010 10th Biennial Conference on Engineering Systems Design and Analysis (ESDA2010)**. This three day conference of ASME is being organized by Yeditepe University and the ASME Turkey Section. The purpose of this letter is to give a brief overview of the current standing of the conference from an organizational viewpoint.

The conference organization started with the launch of conference website at <http://www.asmeconferences.org/esda2010>. An exhaustive effort aimed at announcing and publicizing the conference paid off well, indicated by the large interest received from the related academic and industrial circles. A record number of abstracts (topping 1200) were received, almost half of which (568 to be exact) being accepted as full papers. The accepted papers were categorized into a total of 15 tracks which are: Advanced Energy Systems (42), Advanced Materials and Tribology (56), Applied Mechanics (56), Automotive Engineering and Technologies (40), Bioengineering and Biomedical Technology (19), Computational Mechanics (41), Design Engineering (43), Dynamic Systems and Control (63), Fluids Engineering (30), Heat Transfer (49), Manufacturing Systems (32), Mechanisms and Robotics (34), Mechatronics (14), Micro and Nanotechnology (38), and Science, Engineering & Education (11), where the brackets indicate the number of papers for the respective track. We are expecting that authors of a vast majority of these papers will show up and present their work during the event.

There are five keynote lectures highlighting the conference. The speakers and their respective speech titles are, Dr. C. D. Mote, Jr. (President, University of Maryland): Nurturing Innovation; Dr. Nam Pyo Suh (President, KAIST): Innovative Engineering Systems; Dr. Nihat Berker (President, Sabanci University): Undergraduate Education with Focus on Research; Dr. Hugh Spikes (Professor, Imperial College): Recent Advances in Liquid Lubrication Research; and Dr. Adnan Akay (Vice President, Bilkent University): Dissipation and Irreversible Energy Transfer in Dynamics Systems.

In tandem with the conference there will be professional and student activities in conjunction with ASME. Prior to the conference, an ASME short course program is scheduled to take place between 7-11 July, 2010. This will be the first time such an event has ever been organized in Turkey. In addition, following the conference, the ASME District H Student Professional Development Conference (SPDC) will take place between 14-16 July, 2010. Highlighting this event, a Student Design Contest (SDC) will be held in the conference venue, on July 14, 2010.

A large selection of pre- and post-conference tours is being offered by Interium, the official travel agent for the conference. Social program of the conference includes a welcome reception following a "live documentary" presentation entitled "Istanbul: City of Cities"; a gala dinner at the social facilities of Istanbul Chamber of Commerce located in Cemile Sultan Woods; and a farewell boat cruise aboard a Bosphorus cruise ship.

I would like to take this opportunity to thank the keynote speakers for their participation, authors for submitting their valuable work to the conference, reviewers for taking time and reviewing papers, track chairs for leading their technical tracks, and the conference technical chair for his tremendous effort in organizing the technical content. In addition, to members of the organizing committee who have worked very hard to make **ESDA 2010** a highly successful conference both technically and socially: your tremendous efforts are highly appreciated.

I wish all participants a pleasant week during the conference and for our international guests, I wish you a favorable stay in Istanbul and Turkey. I hope that you spend a memorable time in the next few days and that this conference will produce fruitful results for all of you.

President and Glenn L. Martin Institute, Professor of Engineering
University of Maryland
College Park, MD, USA

ABSTRACT: NURTURING INNOVATION

Innovation is the use of a new idea to introduce a better way of doing something. Innovation refers to a change in thinking, products, ideas, processes, or organizations that leads to a better implementation. Successful implementation is fundamental to innovation. The scales of innovation implementation range from tiny to enormous depending on what is being done.

Innovation occupies our attention today because the solution of almost every major problem is thought to depend on innovation. How will we raise the quality of life for every citizen? The answer is through innovation. How will we increase the standard of living? How will we sustain a competitive national economy? How will we increase the safety of foods, increase productivity, develop alternative energy, combat global warming, ensure national security, fight poverty, reduce health care costs, fight pandemics, provide affordable education, reverse environmental degradation, and so on? The answer is always through innovation.

While much is known about particular innovators and innovative companies, less attention has been paid to: the culture that nurtures innovation and how that culture can be developed so that innovation can address the global problems relying on it. Two great challenges confronting innovation for the world's problems are: (1) How can the pace of innovation be accelerated to keep up with the rate of discoveries in science and technology? (2) How can innovation take on the most complex global challenges – problems like clean water, national security, terrorism, food security, energy, environmental degradation, and climate change?

Today we will discuss nurturing innovation in a connected world that is experiencing accelerating scientific and technological changes. We will review the history that has led to the state of innovation today. The global connectivity among individuals, organizations, and governments has expanded both the pace of innovative development and the scale of problems requiring innovative solutions. We will view innovation in societal layers that will help us see the changes that will be needed for innovation to ultimately fulfill its promise to effectively address our great global challenges.

Dr. Nam Pyo Suh

President
Korea Advanced Institute of Science and Technology (KAIST)
Daejeon, Korea

ABSTRACT: INNOVATIVE ENGINEERING SYSTEMS DESIGNED AND DEVELOPED AT KAIST - OLEV AND MH

Commencing in 2009, KAIST has designed and built two innovative engineering systems: On-Line Electric Vehicle (OLEV) and Mobile Harbor (MH). OLEV is an electric car or bus that draws its electric power from an underground electric power system without using any mechanical contact. The electric power transmitted wirelessly propels the vehicle and also recharges a small battery on board the vehicle. The battery is used to power the vehicle on roads without the underground cable and also when additional power is needed for acceleration. Large OLEV buses and cars draw about 60 kW and 20 kW of maximum power, respectively, from the underground cable. The efficiency of power transmission is over 74%. The EMF generated is well within the regulatory guidelines. The OLEV system was designed and manufactured, including the underground infrastructure, by professors and researchers at KAIST in collaboration with industrial firms, in a relatively short period of time. An OLEV bus is now deployed at the Grand Park of Seoul City. In the near future, KAIST will be installing bus lines in Seoul. In addition to OLEV, KAIST has also designed and installed mobile harbors (MH). MH is a harbor that goes out to large container ships that are moored in deep waters to load and unload containers. The Mobile Harbor eliminates the need for large harbors that are expensive to construct and environmentally undesirable. MH can deliver the cargo to any small port nearest to the final destination. A 1:25 scale Mobile Harbor has been designed and built to demonstrate the key technologies of MH in simulated ocean environment. A systematic design procedure, including Axiomatic Design, was used in designing these complex engineering systems.

ABSTRACT: DISSIPATION AND IRREVERSIBLE ENERGY TRANSFER IN DYNAMIC SYSTEMS

Dissipation refers to conversion of mechanical energy to thermal energy during which the internal energy of the medium increases. In solids, the increase in the internal energy is equivalent to the increase in the kinetic energy of atoms oscillating about their equilibrium positions. In fluids, the increase in internal energy corresponds to the rise in the thermal velocity of the molecules that are in random motion. In both cases, dissipation is an irreversible process where ordered mechanical energy is converted to disordered thermal energy of the molecules. An exception occurs during Brownian motion where at the molecular level energy exchange takes place continuously between molecules in a fluid and a particle, displaying a localized reversible energy exchange between ordered and disordered states. The treatment of dissipation and energy exchange at the molecular level usually requires statistical methods and relies on the collective behavior of molecules in the medium that are too numerous for computational approaches. Inspired by the energy dissipation mechanisms in nature, this presentation demonstrates how nearly-irreversible energy transfer can be realized in linear conservative systems employing a much smaller degree of freedom than the molecular populations solids or fluids provide. Irreversibility in physical systems that have low dimensions normally develops as a result of nonlinearities. In conservative linear systems, energy exchange within a structure or among its modes takes place with some recurrence determined by the system configuration. As shown in this presentation, by suitable selection of system parameters, energy may be transported with near irreversibility, creating an apparent damping effect. The presentation describes mathematical approaches used to identify the system parameters that lead to irreversibility and extends the concept to continuous systems. The presentation concludes with a description of experiments, including an application to reduce vibrations in a satellite.

Dr. Hugh Spikes

Professor of Lubrication
Imperial College
London, UK

ABSTRACT: RECENT ADVANCES IN LIQUID LUBRICATION RESEARCH

Although gas and solid lubrication are becoming increasingly important, liquid and grease lubrication continue to be by far the most widely-used methods of lubricating rubbing contacts in engineering systems.

Historically, the main focus of attention in liquid lubrication research was on extending machine durability by controlling wear, seizure and fatigue of rubbing contacts. However in the last decade, environmental concerns have become the main driver of research. Of paramount importance is now the need to lower friction in machine components and thus increase their efficiency. This is leading to a progressive reduction in the viscosities of lubricants used in machine components, as well as to extensive research on new lubricant components and new surface treatments and coatings able to deliver low friction.

Another trend arising from environmental concerns is replacement in many machine components of traditional steel by lightweight materials such as aluminium alloys and polymers. The lubrication requirements of such materials are necessitating much research, not least to understand properly how lubricants interact with steel so that we can see what changes are needed to lubricate other materials.

Other areas of lubrication research driven by growing concern for the environment include the need for engine lubricants that are compatible with exhaust after-treatment systems, problems of effectively lubricating wind turbine transmission, compatibility of lubricants with biofuels and the design of biodegradable lubricants.

This presentation briefly outlines the widespread impact of environmental concerns on liquid lubrication research and then highlights a few specific examples how new research in liquid lubrication is supporting our quest for a stable and benign environment.

BIOGRAPHY

Hugh Spikes graduated in Natural Sciences from the University of Cambridge in 1968 and obtained his PhD for research in Tribology from Imperial College in 1972. He is currently Head of the Tribology Research Group and Professor of Lubrication in the Mechanical Engineering Department, Imperial College London. His research Group currently comprises five full time academic staff, eleven post doctoral researchers and twenty-six PhD students.

Professor Spikes is a Fellow of the Institution of Mechanical Engineers (IMechE) and also of the Society of Tribologists and Lubrication Engineers (STLE). He has been involved in research in tribology for over forty years and has received a number of recognitions for his research achievements including the ASME Mayo D Hersey Award and the STLE International Award. In 2004 he was awarded the Tribology Trust Tribology Gold Medal, the highest international honour in Tribology. Nine of his research publications have received best paper awards, from STLE, IMechE and ASME.

Professor Spikes' research interests span a wide range of liquid lubrication research, including hydrodynamic, elastohydrodynamic and boundary lubrication. A particular interest has been thin film lubrication and the influence of lubricant composition on the film-forming properties of lubricants and thus on friction and wear performance. Several of the experimental techniques developed during his research have become standard tools for tribology research in industry and academia.

**Dr. A. Nihat Berker**

President
Sabanci University
Istanbul, Turkey

ABSTRACT: UNDERGRADUATE EDUCATION WITH FOCUS ON RESEARCH

The completion of an undergraduate program with very good grades at a top university, by itself, in our times does not amount to a successful university education. Current times require and enable students fresh out of high school, from day number one at their university, to engage in meaningful research and outreach projects, pioneering real-life problems in which even the proper positioning of the problem and method is often a major task and a good part of the solution. This approach, initiated in 1969 at MIT as UROP – Undergraduate Research Opportunities Program, is implemented by faculty proactively seeking the students. This approach, currently conducted in Turkey, will be illustrated by examples: (1) The research engagement of students from their first university year, resulting in top research performance as reflected in publications in leading journals and presentations at international conferences. (2) Intensive graded summer courses for undergraduates, attended by students from dozens of universities, in topics such as Phase Transitions, Renormalization-Group Theory, Condensed Matter Physics, Systems Bipology. (3) Intensive university-level graded summer courses for high school students, attended by students from close to a hundred high schools, in topics such as Augmented Mechanics, Special Relativity, Elementary Quantum Mechanics, Introduction to Antropology, Archeology, Economics, Political Science, Psychology, Sociology. (4) Real community-involvement projects practiced by university students in their first year and beyond. All of these efforts aim at all students being involved in the physical sciences and in the the social sciences and in community outreach activities.

BIOGRAPHY

A. Nihat Berker is the Rector of Sabanci University in Istanbul. His academic specialty is theoretical physics, with over 120 publications and 4200 scientific citations, and he was a faculty member at MIT in 1979-99. He teaches courses in physics (at all levels: undergraduate, graduate, intensive high school), chemistry, and humanities.
